

Subtraction of a Number with up to 2 Decimal Places

$$\begin{array}{r} 2379.55 \\ -2125.24 \\ \hline 1254.31 \end{array}$$

When subtracting decimals it is important to make sure the decimal points are directly underneath each other and each digit is in the correct column.

Subtracting and exchanging from the left to right and recording is completed in the same way as integer (whole number) calculations.
